[PS-05 · Bug-fix agent]

PatchPilot

Paste a GitHub issue. Get a fix proven by a failing-then-passing test, and a PR you approve.

Team · Niranjan Iyer · Swarali Patil · Devansh Narlawar · Sarthak Viche

[The problem]

Bugs eat hours before any fix begins.

Decode what the reporter meant

Reproduce the bug by hand

Hunt for the code responsible

17.3 hrs

a week, on average, that a developer spends on debugging and maintenance.

Source: Stripe, Developer Coefficient, 2018

[The solution]

Paste an issue link. Get a proven fix.

PatchPilot reproduces the bug in a locked-down sandbox and writes a small fix. It proves the fix with a test that fails before and passes after, and opens a pull request only when you approve.

1. **Reproduce**
   A test that fails because of the bug
2. **Fix**
   A small, focused change
3. **Verify**
   The test passes in a fresh sandbox
4. **You approve**
   The PR opens only after you say yes

[The product]

One link in. One proven PR out.

Live run on tinycalc #1, a planted bug in our demo repo

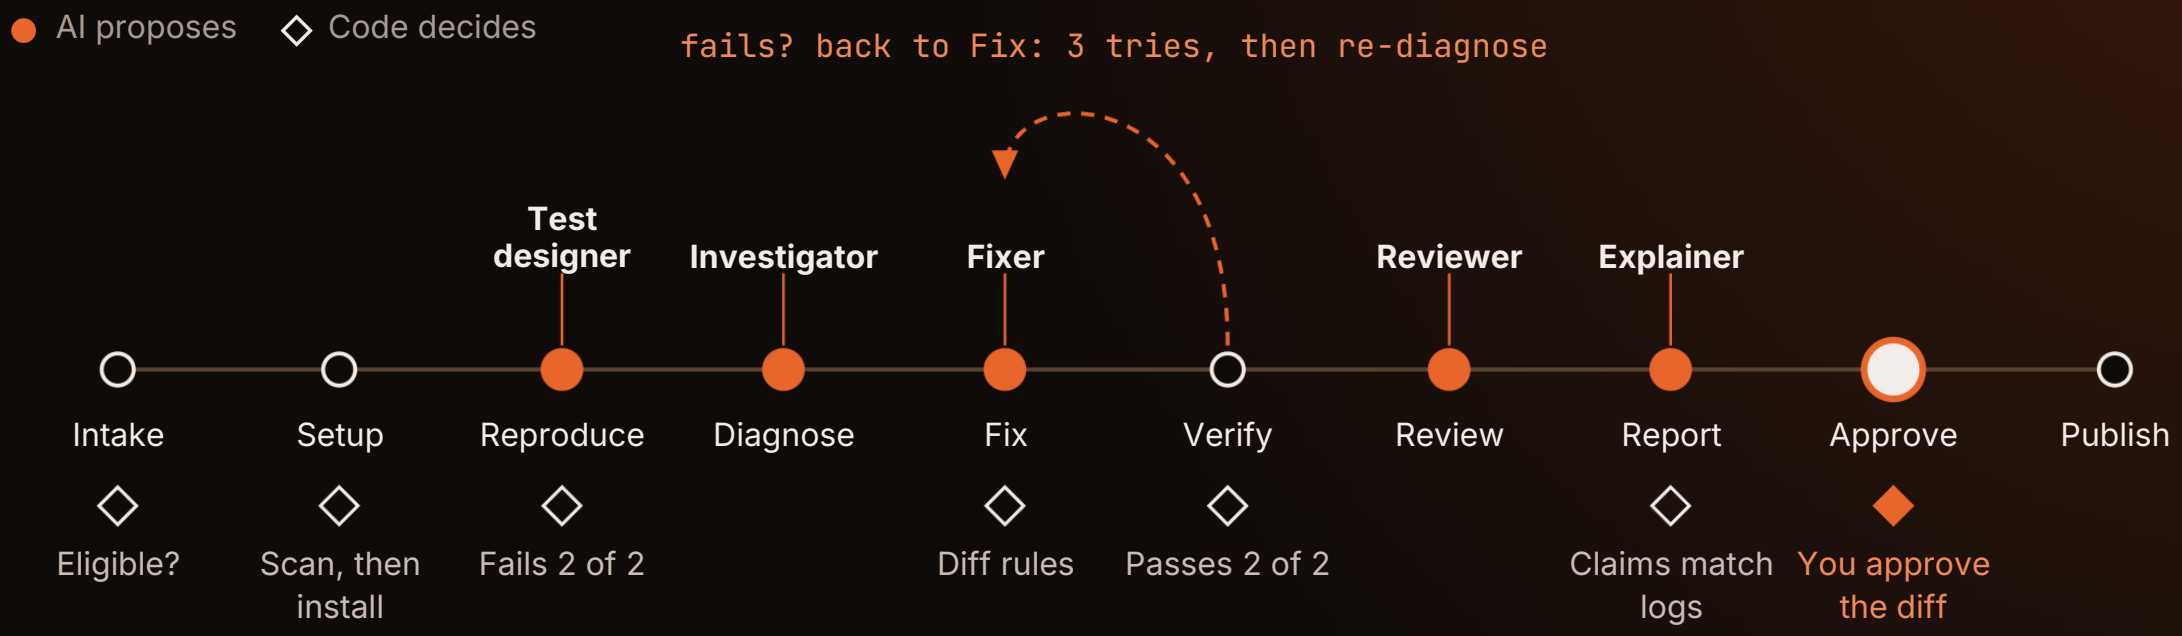

Live today: 3 of 3 planted bugs fixed, 2-7 min each. 2 real draft PRs opened (tinycalc #4, #5).

1. **Proof, not promises**
   The same new test fails 2/2 on the original code, then passes 2/2 after the fix in a fresh sandbox.
2. **Dependency check before install**
   Our own scanner, SupplyGuard, checks every lock file for vulnerabilities and fake packages. A malicious one stops the run.
3. **Safe upgrades, clear reports**
   For vulnerable packages, SupplyGuard suggests compatible upgrades and exports an SBOM and a SARIF report.
4. **Locked-down sandbox**
   Repository code runs with no network and no credentials, in a fresh container for every step.
5. **Checks the AI can't fake**
   A hidden test the fixer never saw, and a code review that flags shortcuts and swallowed errors.
6. **You stay in control**
   You approve the exact diff before a draft PR opens. If a fix can't be proven, you get an honest report.

[Agent orchestration]

Five AI roles. Seven code gates.

If a fix still can't be proven, the run ends with a triage report. Never a fake fix.

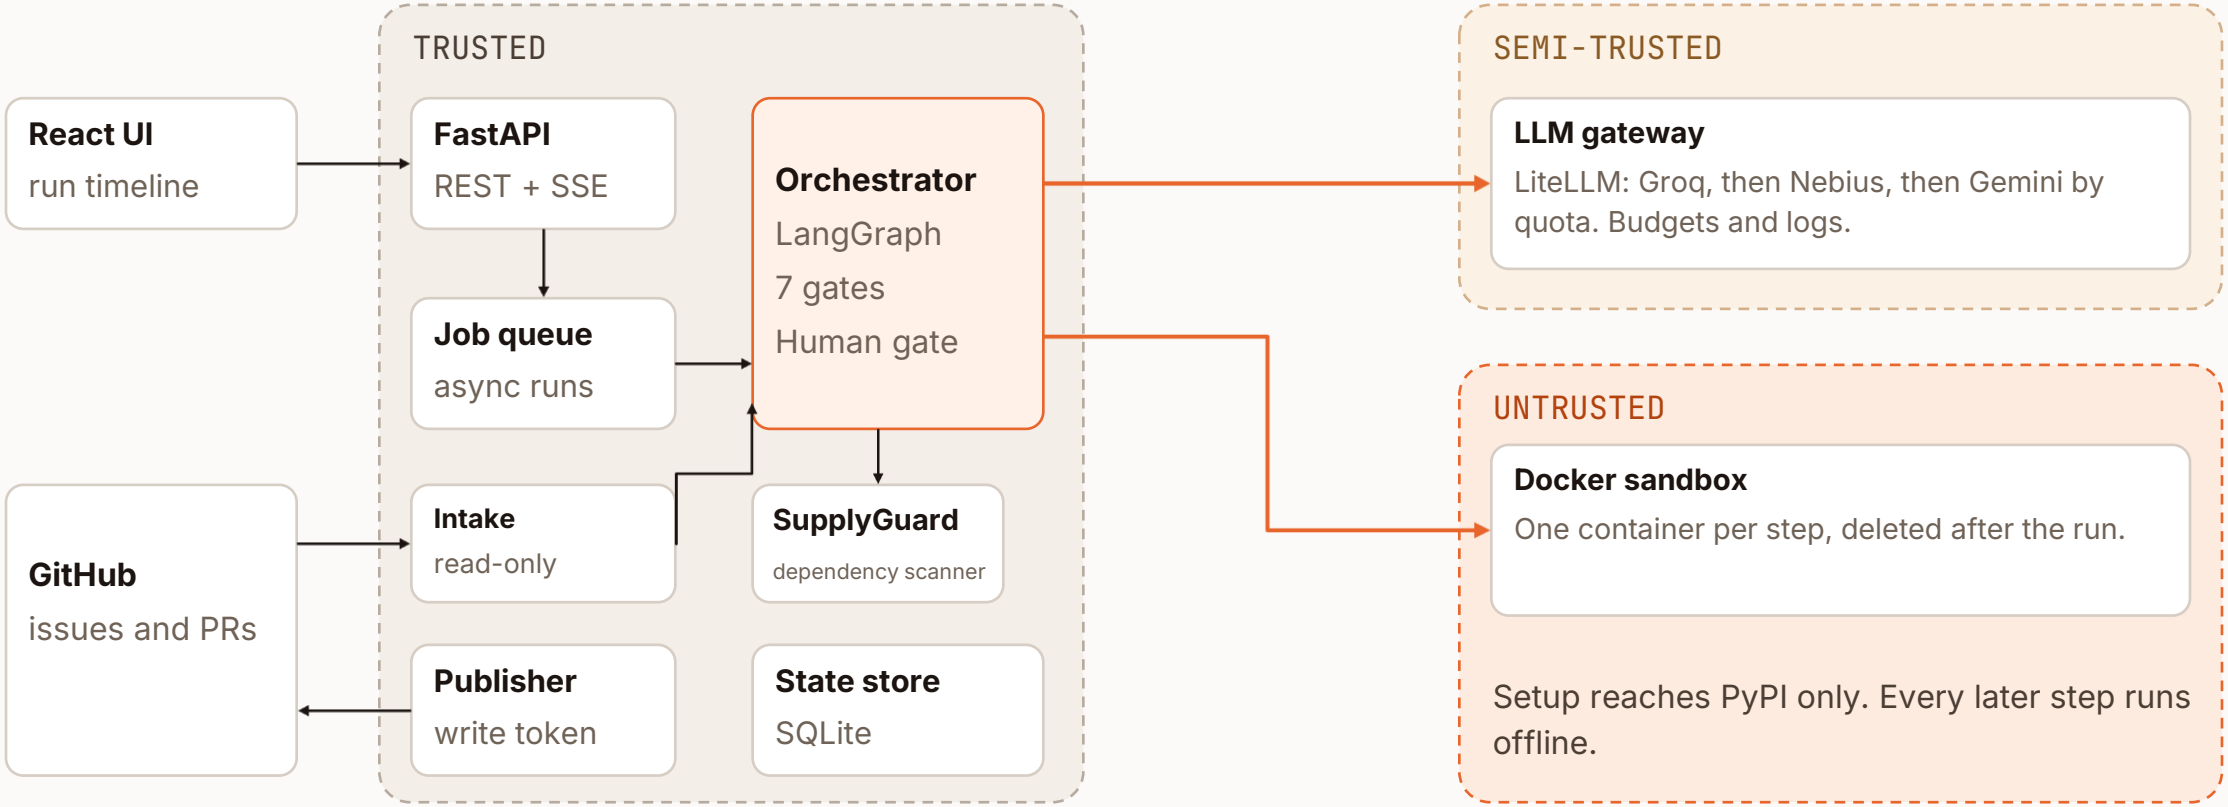

[Why it's safe · system view]

Three zones. One write token.

Built with

React FastAPI LangGraph LiteLLM Python Docker GitHub

SupplyGuard, our own scanner, checks every dependency before anything installs. The AI never holds the write token.

[Who it's for]

Who gets time back.

Open-source maintainers

Clear the bug backlog with proven PRs.

New contributors

Learn a codebase in plain language.

Private repositories and team plans.

Our promise

It proves the fix, or says it can't.

Niranjan Iyer · Swarali Patil · Devansh Narlawar · Sarthak Viche

[In one line]

Bugs in. Proof out.

PatchPilot turns a GitHub issue into a verified fix and a draft PR. A human approves every one.
